NOTES ON RANKING

Ranking is simple. Following are the steps done in ranking pages [descending order]:

1. When a link is fetched, we count number of internal links in it. Variable 'n_links' stores it.
2. Then the link information [url, #links] is appended to 'global_rank' array.
3. When crawling is done the array is sorted in descending order.
4. Then the sorted array is written to file 'ranks.txt' as <#links> <URL> format.
